Excavations

Excavating is part of almost every construction project and presents a wide variety of hazards: heavy equipment, falls, trench collapses, public safety, hazardous atmospheres, electrocution, and explosions. Wall collapses routinely kill workers. Remember that the weight of the soil can suffocate a trapped employee even if the employee's head is exposed. Don't take chances with peoples' lives!

Falls

Falls are one of the leading causes of fatalities on construction sites. That's just the fatalities — there are tens of thousands of non-fatal falls that result in injuries, pain, lost work days, and workers' comp cases.

The most dangerous falls are usually those where someone falls from one level to another, but slips and trips can cause injuries too. Preventing slips and trips requires constant vigilance by both supervisors and employees.

Some of the applicable OSHA standards include:

- Fall Protection Subpart M, starting at 29 CFR 1926.500
- Steel Erection Subpart R, starting at 29 CFR 1926.750
- Stairs & Handrails Subpart X, starting at 29 CFR 1926.1050 (1052)
- Ladders Subpart X, starting at 29 CFR 1926. 1050 (1053)

Protective Systems

In general, fall protection systems are required any time an employee is working six feet or more above a lower level or working surface and the potential for a fall exists. These systems may also be required if an employee could fall into a hazardous area or dangerous equipment even if the fall would be less than six feet.

Training & Documentation

The federal Occupational Safety and Health Administration requires that employees who use or handle hazardous material be properly trained. If hazardous materials are used on your site, proper training is your first line of defense against accidents and injuries and the costs that follow. Beyond training the employees who will use the chemicals, make sure that other employees are explicitly aware that they are **not allowed** to use those chemicals. For more information see the Subpart Z starting at 29 CFR 1910.1000.

Use & Emergencies

Proper use of hazardous materials is extremely important. It is rare that accidents are caused by chemicals that are not in use and properly stored. Using hazardous materials safely starts with good training, but requires diligent enforcement of the rules. Don't forget to follow-up. No one plans chemical emergencies, but you should always plan **for** them. Once an emergency has occurred, it's far too late to establish a plan.

Hazards & Training

Thousands of accidents occur each year because equipment or energy sources were not properly secured. Lockout/tagout most frequently applies to equipment but there are other reasons to lock out systems. Confined space entry may require system lockouts to prevent engulfment or asphyxiation. In general, you should consider locking out any system or equipment which could cause an injury or property damage if it were operated while employees were working in the area.

Shut-down & Restart

Following is a general list of items to consider when shutting-down, testing, locking-out, and finally restarting systems or equipment. Locking out all energy sources is vital to your safety but it can be difficult and complex depending on the systems and equipment involved. Always follow company procedures to the letter and be sure that you truly understand how the system operates and that you are completely safe. Restarting complex systems can be dangerous. Always follow the startup procedures. If necessary, have operating staff and system support staff present.

Breathing Protection

The American Lung Association says it best: "When you can't breathe, nothing else matters!" Breathing protection is necessary on many construction sites. In some cases a simple dust mask may be adequate. In others, a self-contained air supply may be needed. Make sure that a proper hazard evaluation is done **before** any employees are exposed to a potentially harmful atmosphere.

If respirators are being used, cleanliness and fit are extremely important. A little facial hair can break the seal between the respirator and the face and make the respirator useless. An employee could die "by the hair on his chinny chin chin!"

Eye Protection

Eye injuries occur every day on construction sites. They frequently cause permanent, disabling injuries which affect the victim's quality of life forever. Almost all of them can be prevented.

Remember to consider the following types of hazards:

- Impact
- Flying particles
- Dust and mist
- Chemical splash
- Radiation (thermal and UV, typically from welding operations)

Hand & Foot Protection

While most hand and foot injuries are not fatal, they are painful and can be permanently disabling. Many finger, hand, and foot amputations are caused by powerful tools and equipment (saws, presses, forklifts, etc.) and cannot be prevented by PPE. Remind all employees of potential amputation hazards. When they are using saws, train them to not hold the workpiece being cut with their hands.

Hearing & Head Protection

Hearing Protection: Whenever possible, administrative and engineering controls should be used to reduce noise exposure. When those options are not feasible or not sufficient, personal hearing protection is a must. Make sure that the Noise Reduction Rating (NRR) of the hearing protection will sufficiently reduce the noise level at the ear. Proper fit of hearing protection is an absolute necessity for proper protection.

Head Protection: Hard hats are designed to protect against bumps, falling objects, and electrocution. There are two types and three classes of hard hats. Make sure that each of your employees is wearing a hard hat that will provide the protection needed for his or her job.

Type	Impact Protection	Class	Electrical Protection
I	to top of head	C	no electrical protection
II	to top, side, or back of head	G	up to 2200 volts
		E	up to 20,000 volts

Pre-task Checklist

A good pre-task plan can be invaluable for safety, productivity, and morale. If everyone involved really understands what needs to be done it will likely get done more safely and more quickly. You will also reduce the number of misunderstandings which can lead to mistakes, delays, and increased costs.

Site Facilities

Having all of the supplies and equipment that you need to conduct business at a new jobsite can make life simpler and far less hectic. Being prepared means better productivity (no waiting for equipment), improved morale (you look like you know what you're doing), and less downtime (everything is ready to go).
